

What Linux Filesystem ?

✎ It is a Method of storing & organizing arbitrary Collection of data in a human-usable form.

Different types of filesystem supported by Linux :

→ Database Filesystems

Partitions & Filesystems

■ A Partition is a dedicated subsection of Physical storage media.

✓ A File system is just a method of storing & accessing files.

Files exist inside directories, which exist inside **filesystems**, which exist inside **partitions**, which exist on a **physical disk**.

	WINDOWS	LINUX
Partition	Disk1 ✓	/dev/sda1 ✓
Filesystem type ✓	NTFS/VFAT ✓	EXT3/EXT4/XFS/BTRFS... ✓
Mounting parameters ✓	DriveLetter ✓	MountPoint ✓
Base folder (where OS is stored) ✓	C:\	/

File System Hierarchy Standard

- * Linux filesystems store their important Files according to a standard layout called the File system Hierarchy Standard (FHS) which has long been maintained by Linux foundation.

https://refspecs.linuxfoundation.org/FHS_3.0/fhs-3.0.pdf

- * Linux uses '/' character to separate paths.
